ABSTRACT

The article is devoted to learning English through Art. The aim of the article is the analysis of learning English through music. The author comes to the conclusion that the method of learning English through music is one of the effective methods of learning.

KEYWORDS: English, art, learning, method, music.

INTRODUCTION:

English is the most widely spoken language in the world. It is used as a communication tool in about half of the globe. English has been one of the most important international languages for more than two centuries. There are a variety of dialects and dialects of the English language. English (as a second) is spoken in more than 50 countries in the world. English is the language of diplomacy, politics, science, economics, etc. Over 90% of all global media are distributed in English. More than 70% of all scientific articles and journals are published in English.

In the age of progress and technology, knowledge and study of the English language are necessary for every civilized, intelligent, and self-sufficient person. Learning a language is not at all a simple matter. This process can take a lot of time and patience.

There are many methods of learning a language; the main one is memorizing texts, words, etc. It is possible to learn English not only through the "cramming" method but also through games, video tutorials, poems, communication with native speakers and art.

At present, non-traditional teaching methods are appearing that represent an alternative to the traditional classical system.

Non-traditional teaching methods contribute to the formation of motivation for teaching foreign languages [1].

Learning English through music is aimed at implementing a cognitive - communicative approach. This approach makes us take a fresh look at the traditional methods and techniques of teaching a foreign language [2].

The purpose of the article is to learn English through art. And the job is to analyze the process of learning English through music.

Music is far from the last place in art, thanks to its beneficial effects on the human body. And that is why the method of learning a language through music is one of the most effective ways of learning.

The subject of "music" is often in contact with many school subjects. Integrated lessons are bearing fruit, as you can combine subjects that have nothing to do with music.

Nowadays, learning English is an integral part of education. Knowledge of the English language simplifies the likelihood of upcoming studies and employment in Europe. Therefore, when learning English, a variety of techniques are used to facilitate and accelerate the development of this language. Most of them have a vivid emotional effect on students.

A full-fledged establishment of the actual, educational, developmental, and educational tasks of learning can only be subject to the impact not so much on the consciousness of students, but on the sphere of their hobbies, dispositions, and topics [3]. Music is one of the most effective methods of influencing the emotional state of any person. Music is a component of the culture of absolutely any people, thanks to which we can say that if you listen to the music of that nationality whose

language we study in the same language, it is possible to more deeply understand the cultural and everyday features, traditions, worldview and the language itself, as such.

In the 19th century, researcher I. Dogel determined that when listening to music, the pressure and depth of breathing of not only y animals but also y people change. During the operations, many doctors included music: thanks to their observations; we learned that the processes taking place in the patient's body were more harmonious.

Previously, in ancient Greek schools, in order to better remember, they memorized texts by singing. One of the great teachers Ushinsky argued that chanting to class is a powerful teaching method that not only unites students, helps to educate their sensuality, but also contributes to the development of memory.

Learning a language through songs has a fruitful effect on our knowledge in this area because:

1. There is an increase in vocabulary

Suppose our level of expertise is average, we understand the lyrics of modern songwriters, but when we hear the "classical" English singers, we realize that their vocabulary is much broader. Naturally, many words we don't understand. It is one of the opportunities to replenish our knowledge. To do this, write out unfamiliar words and learn.

2. Learning idioms

Listening to some songs, we cannot understand how to translate some lines. Each word turns into some kind of nonsense. These phrases are "idioms." It is recommended to memorize these idioms and remember them.

3. Improving listening comprehension

Listening to a variety of material in English, we are working on listening. Favorite English songs help us get used to foreign speech. Regular listening is of little use. In order to benefit from listening, we need to work on a song. First, you need to choose your favorite

song, but if it is hard to hear, you need to stop at the songs that are performed at a slower pace.

Then we must listen to the song and try to understand as many words as possible. We need to listen not only to the text but also to the intonation of the performer - this also helps us understand the meaning of the song.

Thirdly, we must listen to the composition and, at the same time, read the text, while trying to make out every word in the singer's speech. If there are new words in the text, then they need to be written out in order to pronounce correctly then.

And the latest in the fourth. We are already listening to the composition, but no longer looking at the text. We try to understand every word of the singer.

4. Improving pronunciation.

When learning a language, you should listen to music with the correct pronunciation. After all, without suspecting it, we copy the speech of our favorite artist and, therefore, we can improve our pronunciation.

5. The ability to learn the language wherever conveniently.

Listening to music often serves as an independent work in the study of English [6].

It is necessary to accurately organize independent work on reading newspapers and magazines since it is the correct organization of independent work that represents one of the critical didactic-organizing problems and the basis of university teaching foreign languages.

Both the lyrics and the songs themselves are freely available on the Internet and can be easily found; they can also be saved on any smartphone, tablet, laptop, etc. Therefore, this is one of the available techniques for improving and learning English.

I would like to note three performers whose work has a beneficial effect on the study of a foreign language:

1. British musician "Sting." Each composition of this singer is a masterpiece.

These songs are enjoyable and useful to listen to because they possess not only a pleasant and memorable melody but are also rich in terms of literary expressiveness.

2. Rock band Linkin Park. I would like to draw attention not to the whole work of the group, but to a particular song. Thanks to the composition "Numb" we can learn about many idioms of the English language.

3. Michael Jackson. Listening to Michael's songs, you can catch yourself thinking that not only the words are heard, but the sounds themselves. He has perfect diction, thanks to which it is more pleasant and more accessible for us to learn a language.

Some researchers recommend that parents "familiarize" their children with the English language as early as preschool. Because at this age, the memory of children is more susceptible to learning English and to previously unknown information and then it will be easier for them to study subjects in an educational institution.

When learning English, you can express the methodological prerogatives of songs as follows:

- songs - means of reliable assimilation of the material. Researchers have proven: "In the human brain, different areas have been identified for listening to music and speech. The central part of the brain responsible for music is located in the left hemisphere, which is responsible for creative activity. Only for this reason does it remember and work faster than the speech center situated in the opposite - the right hemisphere. Music, in turn, performs a connecting role; that is, it combines the work of two hemispheres, and therefore information is remembered better than poems.

- songs help to master pronunciation skills. Frequent repetition of simple, short songs helps to consolidate the correct pronunciation;

- Songs help motivate students to study, which is undoubtedly very important because learning without motivation is unproductive.

It must be remembered that the child needs the impressions gained from studying this subject. That is why many educators use the creative aspect of their lessons.

The realization of the tasks of study is likely only when the emotional sphere of students and the personal characteristics of the child is affected. The constant study of songs in the class significantly simplifies the process of learning English.

In conclusion, I would like to note that English plays a significant role in the life of every person. And, therefore, new methods must be invented for more natural language learning.

In my opinion, the method of learning a language through art is the most effective and understandable method for almost the entire audience, since with the help of music we not only learn English but also spiritually educate children, introduce them to art, etc. It can be used not only in English lessons but also in lessons of world and art culture, classroom watches and many others.
