ABSTRACT:

According to experts, as a means of computer training, changes in the method and form of teaching are characteristic features of information technology. Therefore, the issue of identifying and generalizing the problems of teaching drawing in general secondary schools remains relevant.

Because there are a number of issues related to the use of computer graphics in the process of teaching spatial geometric objects and drawing, they have been theoretically sufficiently addressed in the course of our research.

KEYSWORD: In the educational process, appropriate, teaching methods structure, students', learning, of methods, educational technologies.

INTRODUCTION:

Comprehensive education of human has always been a dream of mankind, and our ancestors sought ways and means to teach the younger generation how to enlighten and cultivate, to lead them to perfection.

The national basis of pedagogy is the realization of the problems of education in connection with the national heritage of each nation, as well as universal, universal values. For example, the encyclopedic scholar Abu Rayhan al-Biruni wrote in the Book of Jewels: If a merciful endures hardships as the peace of men; if he gives to others what is given to him without stinginess, without giving to others, such a person is considered a brave man who is famous for such power; he is known for his

meekness, gentleness, steadfastness of will, perseverance, humility, and greatness, and although he is not of this rank, he rises to the highest level. He is respected not by lineage, but by righteousness (with those qualities). "[3] Today, every field needs people who have been favored by A.R. Beruni. Because only such people contribute to the development of the country. This can only be achieved through strong education and training. It is necessary to bring up a perfect person based on the rich experience created by the people, the works of thinkers and scientists. Teaching technology (Figure 1.2.2) plays an important role in the educational process. By improving the stages of teaching technology, the implementation of modern teaching technology guarantees the effectiveness of the learning process. Teaching methods play an important role in the optimal organization and study of the learning process based on modern teaching technology.

MAIN PART:

Therefore, in the implementation of modern teaching technology, the task is to implement modern educational technology by combining non-traditional teaching methods with the traditional teaching methods that make up the current teaching technology learning process.

Below we view the didactic tasks of some of the teaching methods:

- Didactic tasks of e-learning in computerassisted learning technology - independent visual acquaintance with new material, independent mastering of new material, expansion and consolidation of knowledge,

self-control, independent learning, achievement of "free learning", the ability to distinguish basic concepts, formation of skills in working with electronic textbooks;

- Didactic tasks of the video method skills of acquaintance and study of new material, consolidation, generalization, systematization, modeling;
- Didactic tasks of the method of mental attack the acquisition, regulation, consolidation of knowledge, stimulation and formation of interest in learning;
- Didactic tasks of the method of demonstration
 visual acquaintance with new material, study
 and understanding of the formation of
 concepts, observation, analysis, performance
 of actions;
- Didactic tasks of the method of exercises deepening of knowledge, development,
 repetition, strengthening of skills and abilities
 for practical use of the studied material; Laboratory work didactic tasks of the
 method the reception, understanding,
 mastering, consolidation and deepening of
 knowledge of new material, the ability to
 conduct independent research, rational
 solution of problems, the development of
 effective creative thinking, communication
 with equipment, measurement;
- Didactic tasks of the method of working with books - acquaintance, comprehension, mastering new material, expanding and consolidating knowledge, writing abstracts, self-monitoring, independent learning, habits of reading, knowledge of "free reading", the ability to distinguish the main, to take notes, to form structural-logical schemes, to form the basic abstracts, the choice of literature:
- Didactic tasks of the method of discussion the acquisition, organization and consolidation of knowledge, stimulation and formation of interest in learning, communication skills, logical expression of ideas, the formation of questions, the argumentation of conclusions; -

Story - didactic tasks of the method of explanation - narration, explanation, analysis of new material, proof with evidence of various cases; - Didactic tasks of the lecture method - acquaintance with new material, description of complex systems, events and so on.

In the educational process, the appropriate teaching methods and the structure of management of students' learning activities are determined. On this basis, a list of teaching aids is compiled. The system of methods and teaching aids is harmonized with organizational forms, that is, technology is developed, including educational technologies.

the implementation of modern teaching technologies (Table 1), nontraditional teaching methods were generally compared with traditional teaching (Table 1). Comparison of teaching methods Table 1 clearly shows the advantages of non-traditional teaching methods. From this it can be concluded that traditional teaching methods are reshaped and improved by non-traditional teaching methods (using computer technology).

- The task is to develop ways to use computer technology, based on the advantages and peculiarities of computer-assisted learning technology; In contrast to traditional teaching technology, the teaching aids, forms of teaching and active teaching methods required for the implementation of computer-assisted learning technology are selected, identified and the learning process is planned;
- New teaching tools, forms and methods are selected when planning the teaching process of the curriculum and program topics. In the implementation of modern teaching technology based on teaching methods, it is assumed that the teaching tools, forms and methods are focused on the use of computer technology;
- Ways to use computer technology are used in the classroom. Which of the ways of using the developed computer technology is effective is determined by control and results. According to the results, the ways of using computer technology in this group will continue to be used again, or the optimal ways of using computer technology will be redeveloped.

Thus, (Table 2) is a computer-based learning technology that evaluates the learning process as a system, its organizers, that is, the teacher's use of teaching aids, content and methods, the impact of a particular sequence in a given situation and the learning outcome. is done.

Computer-assisted learning technologies are new learning technologies that create forms of learning based on electronic means. The organization and conduct of training,

seminars and practical training, etc. are forms of training, which are carried out in conjunction with teaching aids and methods. According to this system, the teaching process is planned on the basis of curricula and programs in the subject. New teaching tools, forms and methods are selected in the planning of the teaching process.

Computer-assisted learning technology

Teaching aids are auxiliary training materials necessary for the successful implementation of a particular teaching method - tools, weapons, hardware, etc., where the use of computer technology involves computers, video, projectors, screens and other technical means.

Forms of teaching - laboratory, practical classes, colloquiums, etc., are a form of theoretical and practical knowledge, ways to introduce computer technology are developed

on the basis of curricula and programs in science, planning the teaching process.

Teaching methods are first and foremost a process, a way of knowing. It consists of a set of actions aimed at acquiring knowledge of a process (Table 2). The research focused on the introduction of forms, tools and methods of computer-based learning and their coordination with modern teaching methods without abandoning traditional teaching methods, the development of methods of using computer technology.

Computer-assisted learning technologies are new learning technologies that create forms of learning based on electronic means. This, in turn, became the basis for the introduction of computer-assisted forms, tools and methods of research and their coordination with modern teaching methods without abandoning traditional teaching methods, the development of methods of using computer technology.

In order to optimally solve this problem, serious attention was paid to the development of electronic exhibitions and manuals on the subject of "Drawing", the organization of teaching in modern methods, the mental and physical capabilities, abilities and interests of students. To this end, A.R. Works of Beruni [2; A.N.Forobi [1], A.Avloni psychological literature [20; 36], and In the research of U.A.Kasimov [116], strong ideas and opinions on the issues of upbringing a person. the development perfect complexity of the interests of the student period, the formation of curiosities were analyzed and ways to take into account the individual interests of students were studied.

Students can be divided into the following types according to their personal characteristics: • Extrovert (emotionally and environmentally oriented) learner - prefers an active learning process, interaction with other people (social interaction - group assignments,

- exercises). Introvert (focused on the emotional and internal environment) learner the individual enjoys independent learning, i.e. listening to lectures, reading books, and completing written tasks. People differ in their information processing, data perception activities:
- Hearing and verbal perceptors: those who prefer to perceive this type of information tend to listen and summarize the speech;
- Logical-mathematical perceptors: those who prefer to perceive this type of information tend to calculate with more numbers, to reason logically, to justify each reasoning. They remember numbers and dates better.
- Visual, spatial perceivers: Those who prefer to perceive this type of information consider visual aids, different shapes, structural plans, different maps, tables, diagrams, graphs, and diagrams importantly.
- Perceptors through interpersonal interactions and interactions: Those who prefer to perceive this type of information interact with each other in the process of acquiring knowledge. In the educational process, some of them prefer to study independently, to work alone, while some of them seek to work together, to learn in groups. This category of learners is quick to adapt to human relationships, social environment, is interested in learning about people, is more satisfied with the process of interaction, and likes to be around people.
- Self-awareness-based perceptors: learners tend to think more with a focus on self-awareness under the influence of a person's inner feelings and experiences. They tend to be more social and to know and understand those around them better.
- Physical and kinetic perceptors: Some learners are naturally inclined to perform physical activities, enjoy them, and perform physical exercises. They tend to do more practical work, physical labor, exercise with the

help of arm and leg muscles, and the tendency to do different things. Learners who kinesthetically perceive and process information prefer modeled lessons, role-plays, and action-based learning;

- Naturalistic connoisseurs: This category of learners is nature-loving, interested in the flora and fauna, the earth and its structure, working with maps, collecting herbariums and natural objects. They love sciences like biology, geography, physics, animal husbandry and botany.
- Musical, rhythmic perceptors: this category of learners are prone to melodies and songs, are able to perform their actions in accordance with musical rhythms, are emotional, sensitive and intelligent.

For the educator, it is desirable that the learner's interest is related to his or her other individual-psychological qualities: ability, talent, temperament, and character.

Therefore, using a variety of teaching methods, which form the basis of pedagogical technology, with the definition of pedagogical tasks in the teaching of drawing, to develop students' spatial imagination, thinking. speaking - debating, expressing their ideas through geometric spatial images., taking into account the need to ensure interest in science in each subject, the methods of the educational process are selected according to their didactic tasks. implemented through the means. enriching the content of education.

In the process of implementation of modern teaching technology of the subject "Drawing" took into account the level of complexity of the curriculum, interdisciplinary relevance and didactic tasks of teaching methods [Appendix 2, Table 2]. In addition, changes were made to the form of teaching without changing the number of hours of lectures and practical classes in the curriculum.

The principle of unity of theory and practice in the education system is first implemented in

the learning process, depending on the content and specific nature of the subject. These classes will equip them with the experience they need to be able to put complex scientific theories into practice in the future.

Students gain a comprehensive understanding of the essence of the learning material, the laws of nature and social development on a scientific basis, and develop the skills, abilities and competencies necessary for their future practical activities. Therefore, taking into account the characteristics of each subject, it is accepted as a principle of the process to apply educational knowledge studied as much as possible to practice.

The balance of forms, methods and tools of teaching is important for the learning process. While the science of education serves to study knowledge theoretically, to understand logical connections, to develop the ability to think, practical actions, to apply this knowledge in practice, help to form a more complete conviction, skills and abilities.

The conclusion is that the implementation of computer-assisted learning technology in the teaching of the subject "Drawing" simultaneously increases the effective use of information and telecommunications, the ability to work with modern technical means.
