Keywords: Primary education, pedagogue, skills, competencies, methods, modern technology, interactive.

INTRODUCTION:

Educating the younger generation, who are the successors of our future, at the level of today's requirements, creating knowledge, skills and competencies that meet international standards, is the main task of our educators today, encourages them to work harder and do more research. The President of the Republic of Uzbekistan Shavkat Mirziyoyev pays special attention to the development of the public education system, raising the qualifications and prestige of teachers in society, raising the morale of the younger generation. A number of legal and regulatory documents have been passed in the past to enhance the prestige of teachers. There is a movement to respect teachers as the most respected people in the society. This means that the teacher has a great responsibility. To feel responsible, to work tirelessly on ourselves, to read, to search, to broaden our worldview, to win the love of not

only our students, but also our people with our enlightenment, culture, morality, so to speak. Will be needed. Indeed, the teacher is an intellectual who spreads enlightenment to the people. He is a coach who instills changes in society in the minds of young people and leads them to good goals.

Methods, pedagogical technologies not only improve the skills of teachers, but also ensure the interaction of teachers and students. Primary education is the foundation of general secondary education. Therefore, our country pays special attention to improving the quality of primary education. Teachers make extensive use of advanced pedagogical technologies and interactive teaching methods in the classroom.

The Law of the Republic of Uzbekistan "On Education" of August 29, 1997 provides for the formation of the basics of literacy, knowledge and skills necessary for primary and secondary education. Primary education includes classes in mother tongue, mathematics, medicine, history (based on historical texts), Russian language, fine arts, and physical education based on the curriculum. Education has always been one of the most important responsibilities. From time immemorial, our people have paid great attention to the education and spirituality of children. In today's rapidly evolving world, the development of young people who are able to meet the demands of the times in all respects is primarily the responsibility of primary school teachers.

Primary education is the first stage of general secondary education, and the first education of children is the beginning of their spiritual development. It is important to determine the content of education. Primary education requires the judicious use of a variety of teaching methods, forms and tools to achieve the teaching and acquisition of knowledge, skills and competencies set out in the school curriculum.

At the heart of our reforms today is the transformation of the student into an active participant in the educational process. This, of course, can be achieved through the use of interactive methods. The term "interaction" is derived from the English word "interact" to refer to an activity or problem in an interaction, interaction, discussion, called discussion, in the course of reasoning, means a solution by consensus.

In the system of primary education, the teacher is always ready to teach if he / she fulfills the following tasks in the teaching process.

- The student is not indifferent during the lesson, independent thinking, creativity encourage and support research and development;
- To ensure that students' interests are continuously ensured during the learning process and that students feel that they are interested in their interests;
- Ensuring that students have a creative approach to each issue and that they are free to think about it;
- The teacher and the student should be in a constant process of cooperation.

If the teacher takes the above tasks seriously and is not indifferent, he will be on the right track and will not get into trouble during the lessons. Lessons based on pedagogical technologies should be adapted to the needs of students in terms of organizational methods and teaching methods. Because such

lessons are closer to the child's psyche. Students' interest in learning materials is motivated to achieve goals based on their desires and aspirations, which is the inner rapprochement between teacher and students. The uniqueness of the use of innovative technologies in the classroom is that they are realized through the interaction of teachers and students. The teaching process involves teachers and students. The teacher's job is to describe the material, to stimulate students' interest in science, to deepen their thinking and form their beliefs, to guide students' independent learning, and to examine and evaluate their knowledge, skills and abilities. Assessment of students' knowledge is necessary for regular preparation of students for international research methods - TIMSS, PIRLS, PISA. The purpose of participating in these programs is not to conduct tests or prepare students for the test, but to train competitive personnel. The main condition of modern lessons that can meet today's requirements is that it is interesting and does not bore students. Modern in such lessons that encourage the student to study independently the use of innovative technologies is of great importance. Through interactive methods, students become more active and their creative potential is realized. Modern pedagogical technologies help to develop students' mental, physical, moral, spiritual, psychological, aesthetic and artistic skills. Interactive methods encourage students to use their inner potential, to think, to think freely, to communicate and to be creative. The following methods can be used in elementary school. The development of a well-rounded personality and the formation of basic knowledge in it takes place in the primary grades of secondary schools. The organization of classes in the primary school, as mentioned, requires a high level of knowledge, talent and skills from the teacher and requires skills. A teacher-

organized lesson plays an important role in developing students' competencies. There is a growing interest in the use of interactive methods, innovative technologies, pedagogical and information technologies in education. One of the reasons for this is that while traditional education has been conducted in the same way so far, in modern education both the teacher and the student have greater demands on themselves, work more actively, and strive. Classes based on pedagogical technology encourage young people to express their attitudes to life situations, to satisfy their aspirations, to think, to justify their views. The role and importance of modern teaching methods, interactive methods, and innovative technologies in the educational process of educational institutions is incomparable. Knowledge and experience of pedagogical technologies and their application in education ensure that students have knowledge and advanced skills. The lesson, taught using modern pedagogical and information and communication technologies, is such that in the process no student is left out, that is, they have the opportunity to openly express their thoughts on what they see, know and think. Teaching the younger generation at the level of today's requirements, the formation of knowledge, skills and competencies in accordance with international assessment criteria is the main task of us educators today, encouraging them to work harder and do more research? The main task of our educators is to educate today's young generation at the level of modern requirements, using innovative technologies. In conclusion, the use of innovative technologies in the teaching process and the demonstration of students' abilities and capabilities in the formation of teaching skills based on modern methods in primary education is also important.
